1. function.bind / arrow functions

```js
export default class NotesApp extends Component {
    state = {
        notes: []
    }

    handleNoteDelete = (noteId) => {
        this.setState({
            notes: this.state.notes.filter(note => note.id !== noteId)
        });
    }

    handleNoteAdd = (newNote) => {
        this.setState({
            notes: [newNote, ...this.state.notes]
        });
    }

    render() {
        return (
            <div className="app">
```

or even better to use arrow functions for methods ←

2. ARRAYS / OBJECTS CREATION
